Computer-assisted proofs for existence of strange attractors for nonlinear Leslie population models

Associate Professor Chen-Chang Peng
Department of Applied Mathematics
National Chiayi University

In this talk we employ computer-assisted proofs based on shadowing proving existence of degenerate snapback repellers and also show that existence of global tangent bifurcations. Second, applying the celebrated work of Wang and Yang about strange attractors in 2008 we prove that existence of strange attractors for higher dimension nonlinear Leslie matrix population models.
