

# **Quantum transport through single alkanedithiol molecular junctions**

Arijit Sen and Chao-Cheng Kaun

Research Center for Applied Sciences, Academia Sinica

While coupled covalently to gold leads, a single alkanedithiol molecule exhibits high (HC) and low (LC) conductance. What causes the simultaneous unveiling of different conductance has remained quite obscure. Here we show how the principal contribution may come from the quantum interference of two available states near the Fermi level within the molecular moiety.
